

# **Formal security analysis and certification in industry, at the examples of an AADS<sup>1</sup> and the AVANTSAR project**

Dr. David von Oheimb  
Siemens Corporate Technology, Security

Guest lecture in the 'Software-Sicherheit' series at the  
IT security group of Univ. Passau, Germany, 11 Jul 2011

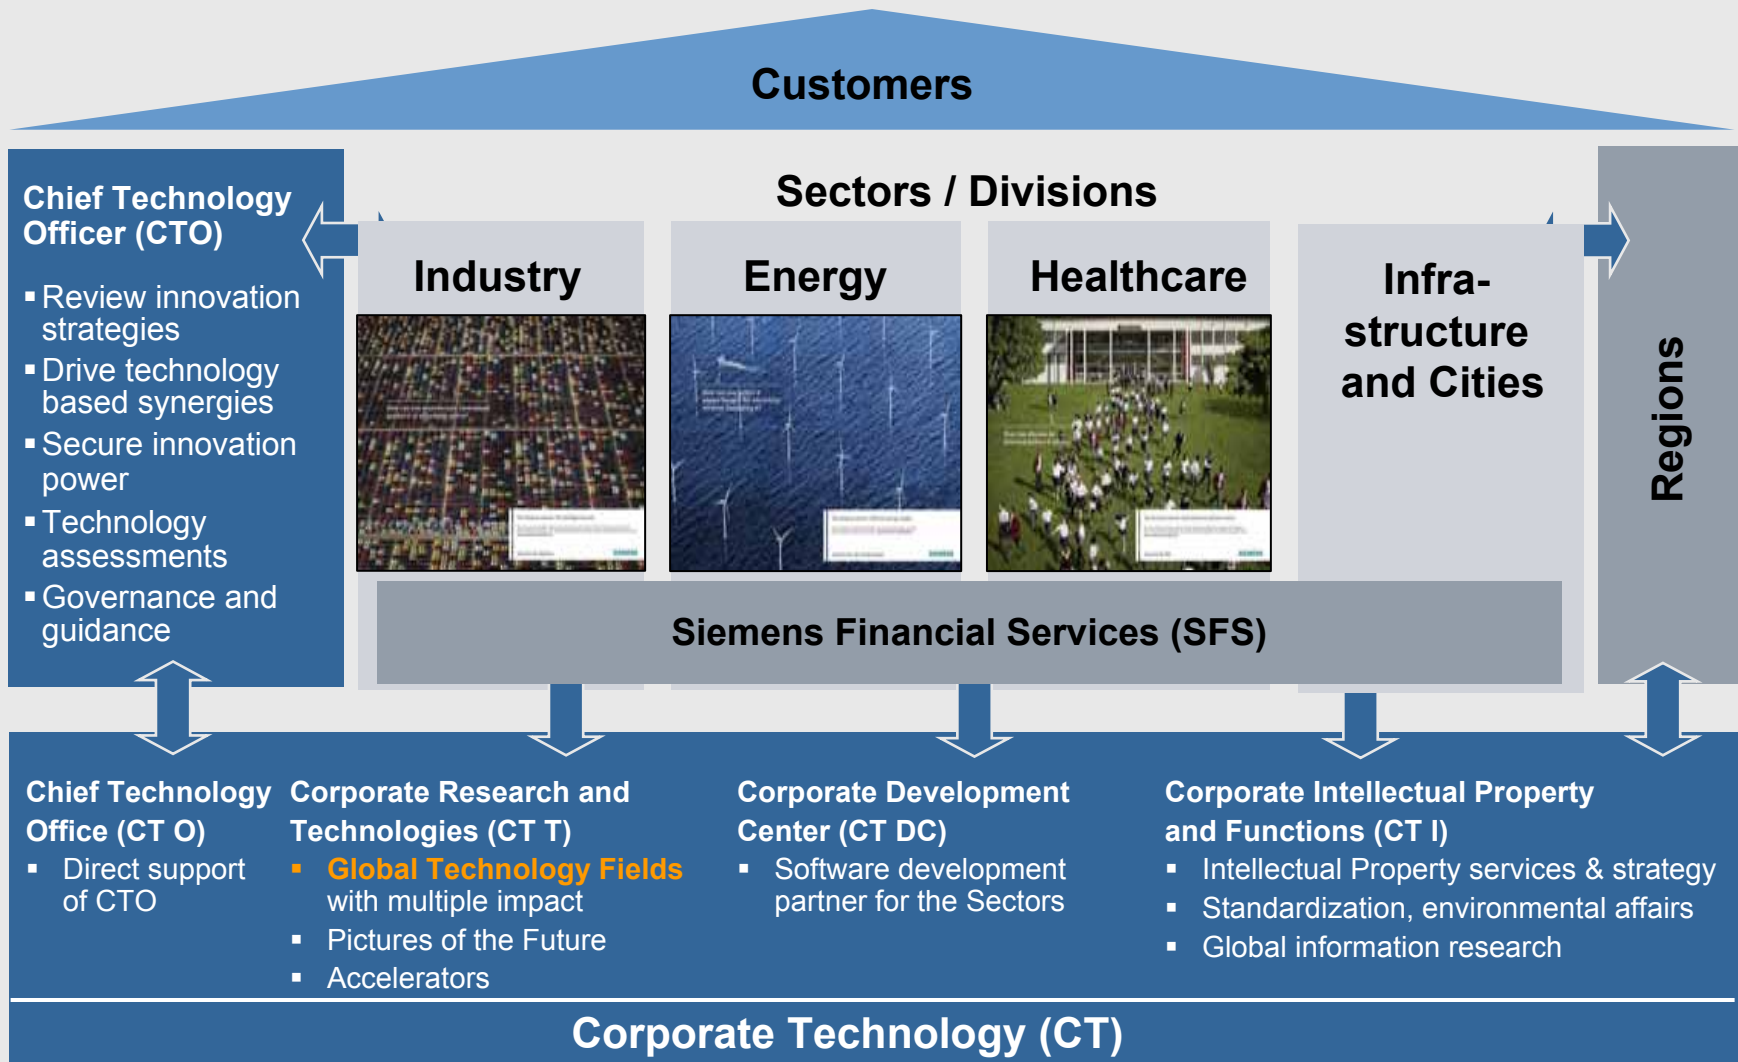

<sup>1</sup>**Airplane Assets Distribution System**

## Overview

- **IT Security at Siemens Corporate Technology**
- Software distribution systems
- Common Criteria certification
- Formal security analysis
- Alice-Bob protocol model
- Validation with AVISPA Tool
- Conclusion on AADS
- Research project AVANTSSAR

# Corporate Technology: Role within Siemens

## Networking the integrated technology company

# Corporate Technology: around 3,000 R&D employees Present in all leading markets and technology hot spots

**SIEMENS**

# GTF IT-Security – Competences ensure innovation for secure processes and protection of critical infrastructure

## Competences Areas

### Communication and Network Security

- Secure Communication Protocols and IP-based Architectures
- Sensor & Surveillance Security
- Security for Industrial Networks, Traffic Environments, and Building Technologies

### Application Security & Methods

- Secure Service Oriented Architectures
- Enterprise Rights Management
- Trusted Computing
- Control Systems & SCADA Security
- **Certification Support & Formal Methods**

### Cryptography

- Security for Embedded Systems
- RFId Security
- Anti-counterfeiting / anti-piracy
- Side Channel Attack Robustness

**Fields**

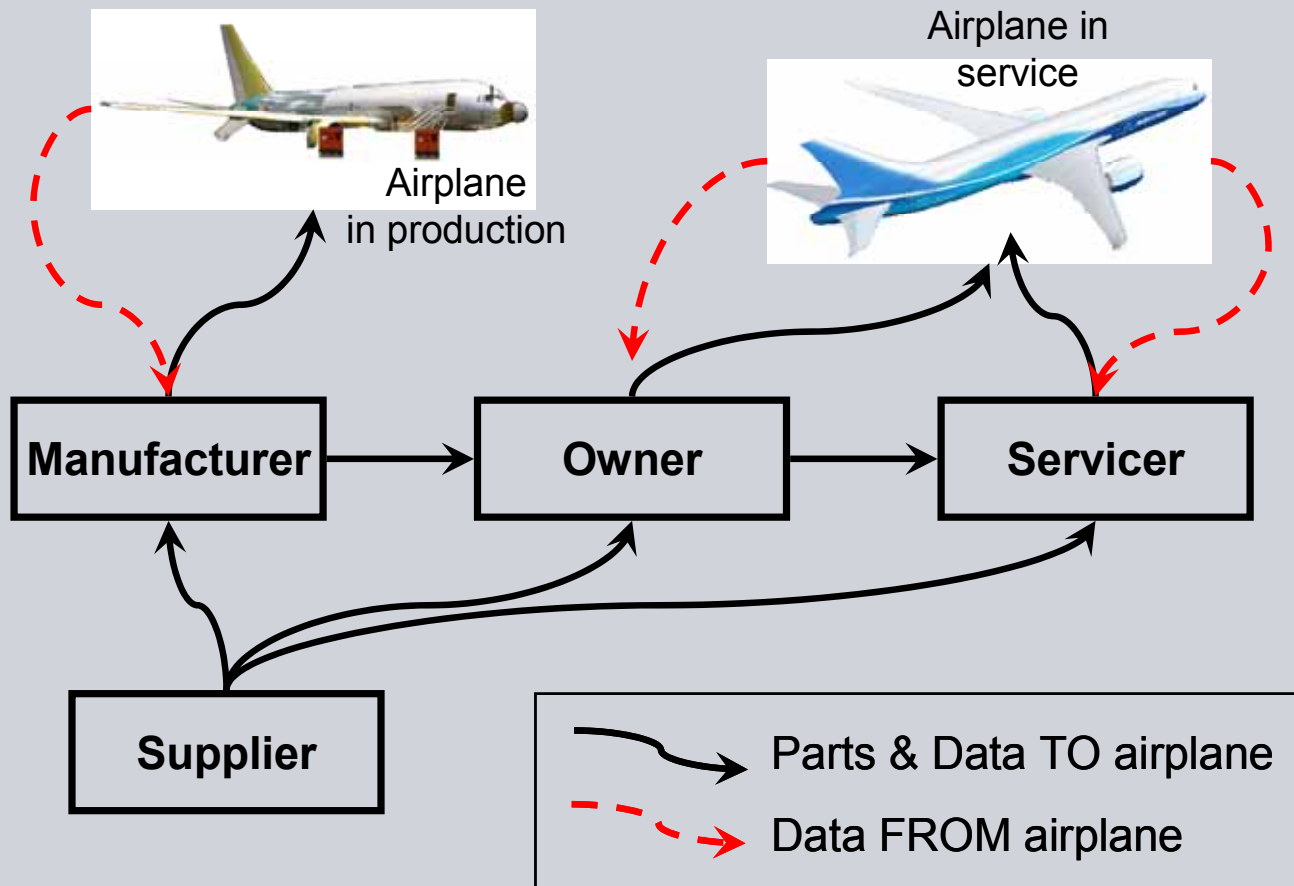

## Overview

- IT Security at Siemens Corporate Technology
- **Software distribution systems**
- Common Criteria certification
- Formal security analysis
- Alice-Bob protocol model
- Validation with AVISPA Tool
- Conclusion on AADS
- Research project AVANTSSAR

## Airplane Assets Distribution System (AADS)

AADS is a system for storage and distribution of airplane assets, including *Loadable Software Airplane Parts (LSAP)* and airplane health data

## Airplane Assets Distribution System architecture

A complex distributed store-and-forward middleware with OSS components

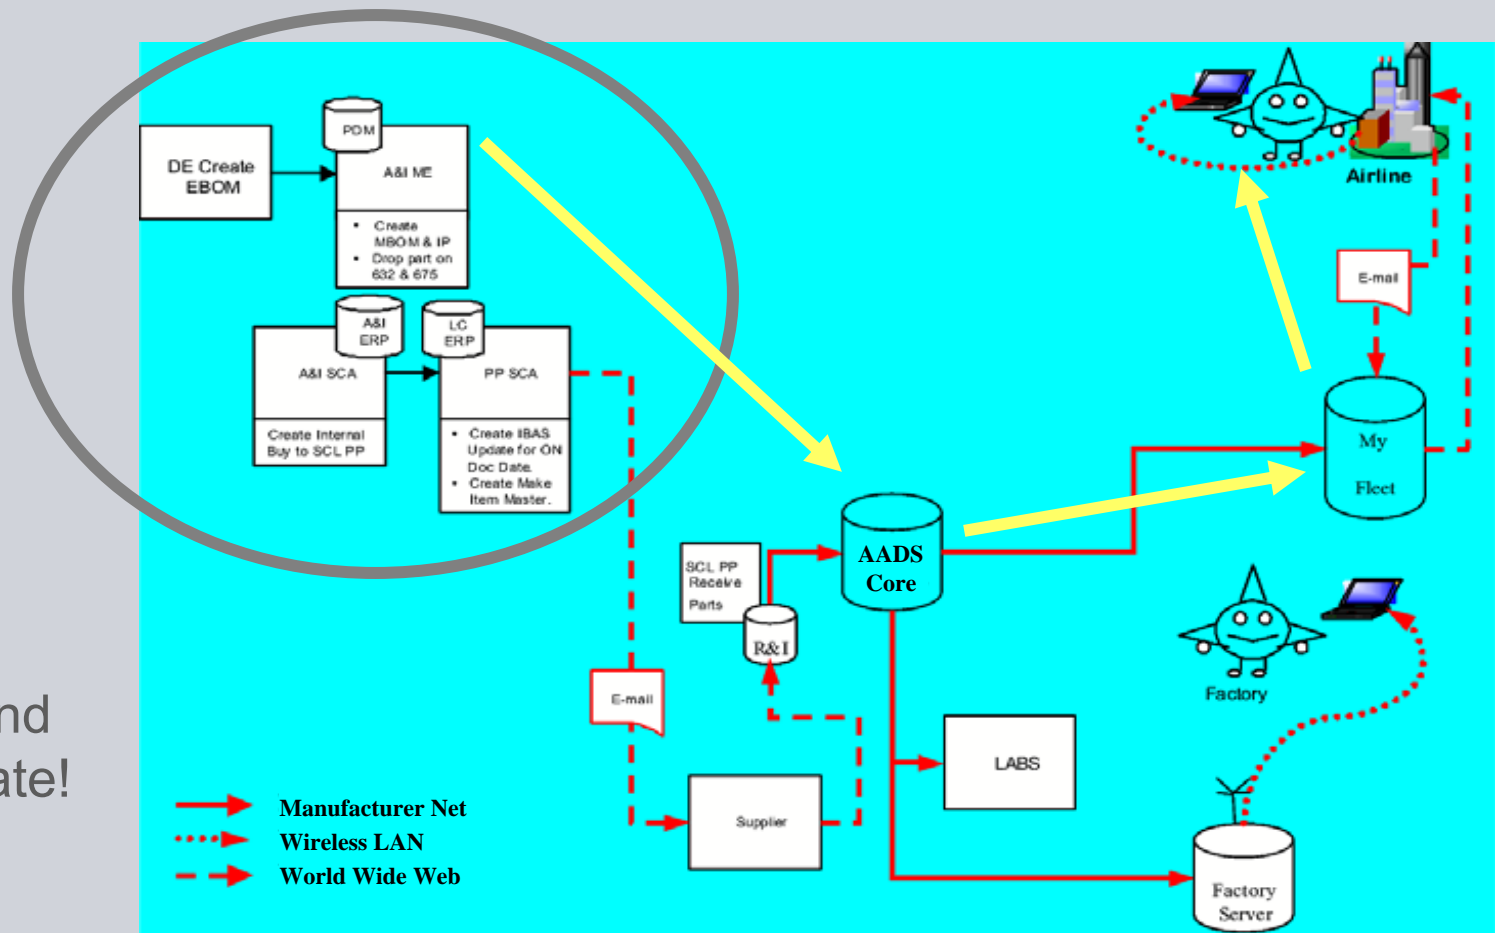

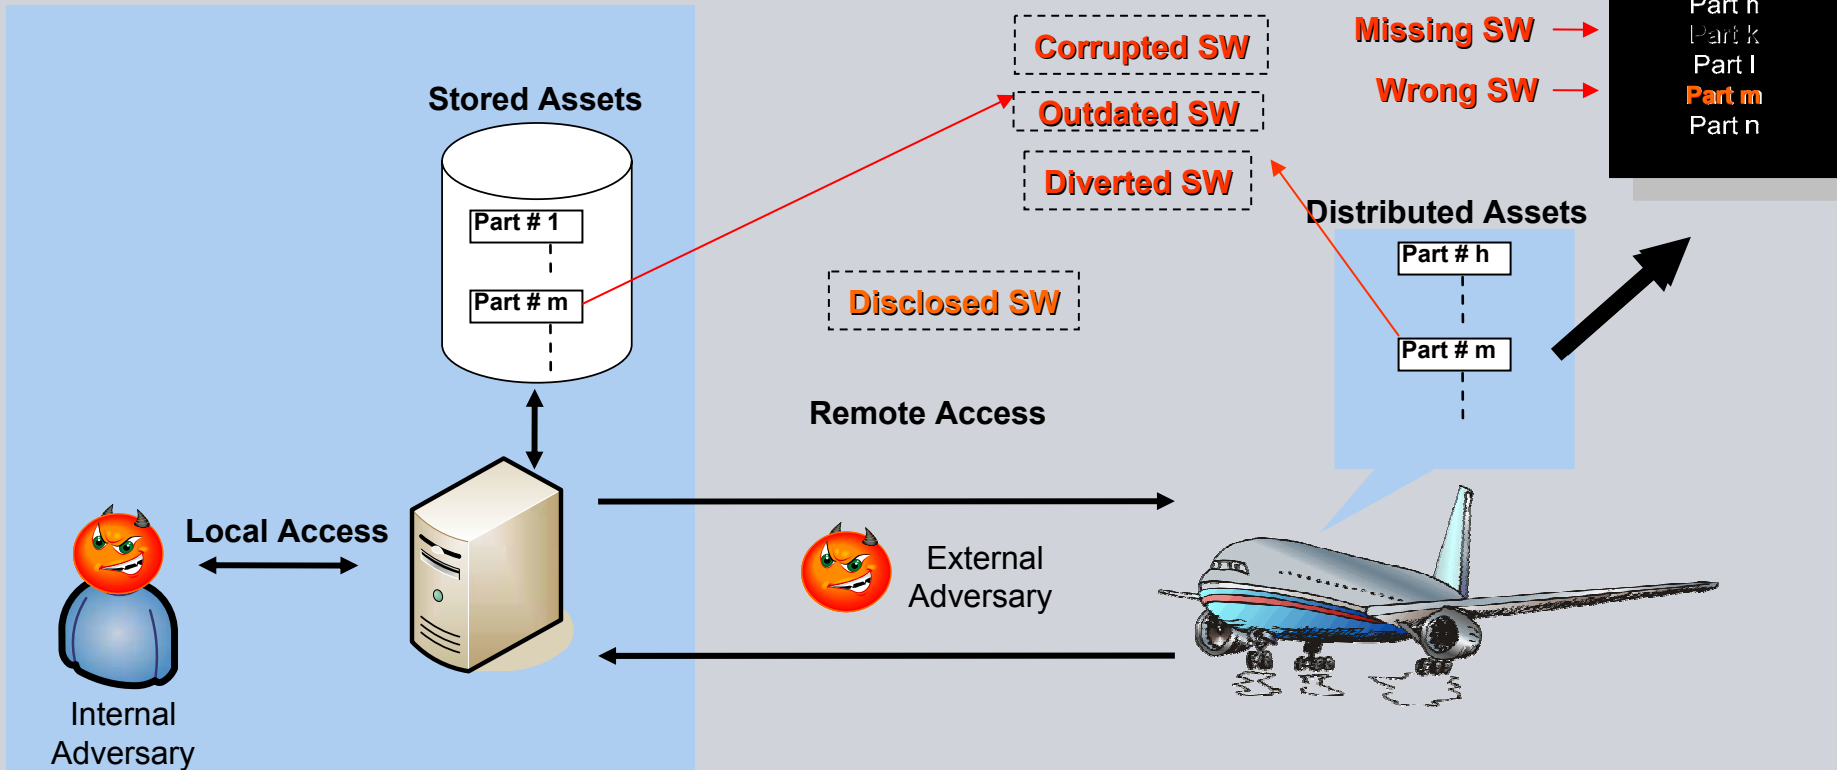

Figure is simplified and not up-to-date!

## Security threats at the AADS example

**Attacker's objective:** lower airplane safety margins by tampering software that will be executed onboard an airplane

**Corruption/Injection**

**Wrong Version**

**Diversion**

**Disclosure**

## Software Distribution System (SDS)

ICT systems with **networked devices** in the field performing **safety-critical** and/or **security-critical** tasks. Field devices require **secure software update**.

→ **Software Distribution System (SDS):**

System providing secure distribution of **software (SW)** from software supplier to target devices in the field

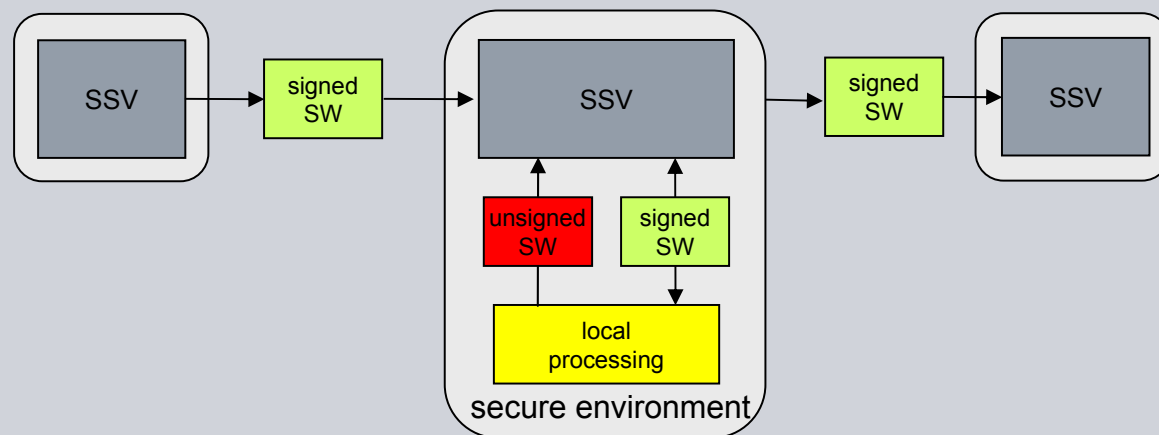

**Transition** from media-based (CD-ROMs etc.) **to networked SW transport** **increases security risks** due to transport over open, untrusted networks

## Software Signer Verifier (SSV)

Each node in SDS runs an SSV instance, used for:

- **Introducing** unsigned software into the SDS, by digitally signing and optionally encrypting it
- **Verifying** the signature on software received from other SSVs, checking integrity, authenticity and authorization of the sender
- **Approving** software by adding an authorized signature
- **Delivering** software out of the SDS after successfully verifying it

## Overview

- IT Security at Siemens Corporate Technology
- Software distribution systems
- **Common Criteria certification**
- Formal security analysis
- Alice-Bob protocol model
- Validation with AVISPA Tool
- Conclusion on AADS
- Research project AVANTSSAR

## IT Security as a System Engineering Problem

- **IT security** aims at preventing, or at least detecting, unauthorized actions by agents in an IT system.

In the AADS context, security is a prerequisite of safety.

- **Safety** aims at the absence of accidents (→ airworthiness)

**Situation:** security loopholes in IT systems **actively exploited**

**Objective:** **thwart attacks** by eliminating vulnerabilities

**Difficulty:** IT systems are very complex. Security is interwoven with the whole system, so **very hard to assess**.

**Remedy:** evaluate system following the **Common Criteria** approach

- address security **systematically in all development phases**
- perform document & code reviews and tests
- for maximal assurance, use **formal modeling and analysis**

## Common Criteria (CC) for IT security evaluation

product-oriented methodology  
for IT security assessment

**ISO/IEC standard 15408**

Current version: 3.1R3 of Jul 2009

**Aim:** gain **confidence** in the security of a system

- What are the **objectives** the system should achieve?
- Are the **measures** employed **appropriate** to achieve them?
- Are the measures **implemented and deployed correctly**?

## CC General Approach

**Approach:** assessment of system + documents by neutral experts

- Gaining understanding of the system's security functionality
- Checking evidence that the functionality is correctly implemented
- Checking evidence that the system integrity is maintained

## CC Process Scheme

Certification according to the Common Criteria is a rather **complex**, **time consuming** and **expensive** process.

A successful, approved evaluation is awarded a **certificate**.

## CC: Security Targets

**Security Target (ST):** defines extent and depth of the evaluation  
for a specific product called *Target of Evaluation (TOE)*

**Protection Profile (PP):** defines extent and depth of the evaluation  
for a whole class of products, i.e. firewalls

STs and PPs may inherit (*'claim'*) other PPs.

ST and PP specifications use **generic** “construction kit”:

- Building blocks for defining *Security Functional Requirements (SFRs)*
- Scalable in depth and rigor: *Security Assurance Requirements (SARs)*

layered as *Evaluation Assurance Levels (EALs)*

## AAADS Security Specification: CC Protection Profile (1)

1. Introduction
2. System Description - Target of Evaluation (TOE)
3. Security Environment
  - Assets and Related Actions
  - Threats
  - Security Assurance Requirements (EAL)
  - Assumptions
4. Security Objectives

## CC: Security Functional Requirements (SFRs) overview

### FAU: Security audit

- Security audit automatic response (FAU\_ARP)
- Security audit data generation (FAU\_GEN)
- Security audit analysis (FAU\_SAA)
- Security audit review (FAU\_SAR)
- Security audit event selection (FAU\_SEL)
- Security audit event storage (FAU\_STG)

### FCO: Communication

### FCS: Cryptographic support

### FDP: User data protection

### FIA : Identification and authentication

### FMT: Security management

### FPR: Privacy

### FPT: Protection of the TSF

### FRU: Resource utilization

### FTA: TOE access

### FTP: Trusted path/channels

# CC: EALs

Security Assurance Requirements (SARs)

grouped as

Evaluation Assurance Levels (EALs)

Assurance class	Assurance Family	Assurance Components by Evaluation Assurance Level						
		EAL1	EAL2	EAL3	EAL4	EAL5	EAL6	EAL7
Development	ADV_ARC		1	1	1	1	1	1
	ADV_FSP	1	2	3	4	5	5	6
	ADV_IMP				1	1	2	2
	ADV_INT					2	3	3
	ADV_SPM						1	1
	ADV_TDS		1	2	3	4	5	6
Guidance documents	AGD_OPE	1	1	1	1	1	1	1
	AGD_PRE	1	1	1	1	1	1	1
Life-cycle support	ALC_CMC	1	2	3	4	4	5	5
	ALC_CMS	1	2	3	4	5	5	5
	ALC_DEL		1	1	1	1	1	1
	ALC_DVS			1	1	1	2	2
	ALC_FLR							
	ALC_LCD			1	1	1	1	2
ALC_TAT				1	2	3	3	
Security Target evaluation	ASE_CCL	1	1	1	1	1	1	1
	ASE_ECD	1	1	1	1	1	1	1
	ASE_INT	1	1	1	1	1	1	1
	ASE_OBJ	1	2	2	2	2	2	2
	ASE_REQ	1	2	2	2	2	2	2
	ASE_SPD		1	1	1	1	1	1
	ASE_TSS	1	1	1	1	1	1	1
Tests	ATE_COV		1	2	2	2	3	3
	ATE_DPT			1	2	3	3	4
	ATE_FUN		1	1	1	1	2	2
	ATE_IND	1	2	2	2	2	2	3
Vulnerability assessment	AVA_VAN	1	2	2	3	4	5	5

## CC: Evaluation Assurance Level 2

Development	ADV_ARC.1 Security architecture description ADV_FSP.2 Security-enforcing functional specification ADV_TDS.1 Basic design
Guidance documents	AGD_OPE.1 Operational user guidance AGD_PRE.1 Preparative procedures
Life-cycle support	ALC_CMC.2 Use of a CM system ALC_CMS.2 Parts of the TOE CM coverage ALC_DEL.1 Delivery procedures
Security Target Evaluation	ASE_XXX ( <i>6 families of components</i> )
Tests	ATE_COV.1 Evidence of coverage ATE_FUN.1 Functional testing ATE_IND.2 Independent testing - sample
Vulnerability analysis	AVA_VAN.2 Vulnerability analysis

## CC: Evaluation Assurance Level 4

Development	ADV_FSP.4 <b>Complete</b> functional specification ADV_IMP.1 <b>Implementation representation of the TSF</b> ADV_TDS.3 Basic <b>modular</b> design
Guidance documents	
Life-cycle support	ALC_CMC.4 <b>Production support, acceptance procedures and automation</b> ALC_CMS.4 <b>Problem tracking</b> CM coverage ALC_DVS.1 <b>Identification of security measures</b> ALC_LCD.1 <b>Developer defined life-cycle model</b> ALC_TAT.1 <b>Well-defined development tools</b>
Security Target Evaluation	
Tests	ATE_COV.2 <b>Analysis</b> of coverage ATE_DPT.2 <b>Testing: security enforcing modules</b>
Vulnerability analysis	AVA_VAN.3 <b>Focused</b> vulnerability analysis

## CC: Evaluation Assurance Level 6

Development	<b>ADV_FSP.5</b> Complete <b>semi-formal</b> functional spec. <b>with additional error information</b> <b>ADV_IMP.2</b> Implementation of the TSF <b>ADV_INT.3</b> Minimally complex internals <b>ADV_SPM.1</b> <b>Formal</b> TOE security policy model <b>ADV_TDS.5</b> Complete semiformal modular design
Guidance documents	
Life-cycle support	<b>ALC_CMC.5</b> Advanced support <b>ALC_CMS.5</b> Development tools CM coverage <b>ALC_DVS.2</b> Sufficiency of security measures <b>ALC_TAT.3</b> Compliance with implementation standards – all parts
Security Target Evaluation	
Tests	<b>ATE_COV.3</b> Rigorous analysis of coverage <b>ATE_DPT.3</b> Testing: modular design <b>ATE_FUN.2</b> Ordered functional testing
Vulnerability analysis	<b>AVA_VAN.5</b> Advanced methodical vulnerability analysis

## CC: Factors determining the evaluation effort

- Boundary of TOE vs. TOE environment
- Definition of Threats and Security Objectives for the TOE
- Definition of Security Functional Requirements (SFRs)
- Selection of Evaluation Assurance Level (EAL)

## Selection of Evaluation Assurance Level (EAL) for AADS

	Flight safety	Airline business
<b>Threat Level</b> assume sophisticated adversary with moderate resources who is willing to take <b>XXX risk</b>	<b>T5: XXX = significant</b> e.g. intl. terrorists	<b>T4: XXX = little</b> e.g. organized crime, sophisticated hackers, intl. corporations
<b>Information Value</b> violation of the protection policy would cause <b>YYY damage</b> to the security, safety, financial posture, or infrastructure of the organization	<b>V5: YYY=</b> <b>exceptionally grave</b> Risk: loss of lives	<b>V4: YYY = serious</b> Risk: airplanes out of service, or damage airline reputation
<b>Evaluation Assurance Level</b> for the given Treat Level and Information Value	<b>EAL 6: semiformally verified design and tested</b>	<b>EAL 4: methodically designed, tested, and reviewed</b>

Evaluating the whole AADS at EAL 6 would be extremely costly.  
 Currently available Public Key Infrastructure (PKI) certified only at EAL 4.  
 Two-level approach: evaluate only LSAP integrity & authenticity at EAL6.

## Hybrid security assessment

- Highest CC evaluation assurance levels (EAL 6-7) require formal analysis
- SDS usually are complex distributed systems with many components

General problems:

- Highly critical system, but (complete) formal analysis too costly
- CC offer only limited support (“CAP”) for modular system evaluation

### Pragmatic approach:

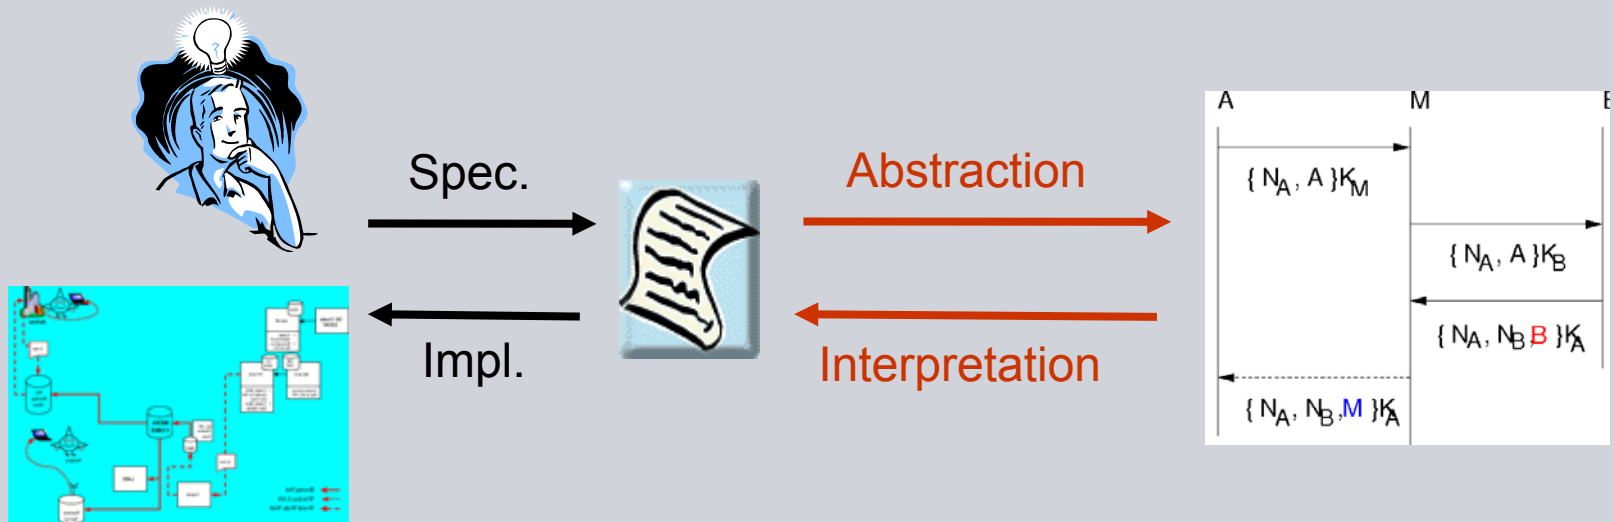

- Define **confined security kernel** with generic component: SSV
- **Software Signer Verifier (SSV)** handles digital signatures at each node
- Evaluate **SSV** according to Common Criteria EAL4 (non-formal)
- Analyze the interaction of SSVs in a formal way (→ crypto protocol)

## Overview

- IT Security at Siemens Corporate Technology
- Software distribution systems
- Common Criteria certification
- **Formal security analysis**
- Alice-Bob protocol model
- Validation with AVISPA Tool
- Conclusion on AADS
- Research project AVANTSSAR

## Formal Security Analysis: Approach and Benefits

Mission: security analysis with **maximal precision**  
 Approach: **formal modeling and verification**

Improving the **quality**  
 of the system **specification**

Checking for the existence  
 of **security loopholes**

High-Level Protocol Spec. Language  
 Model checkers (**AVISPA tools**)

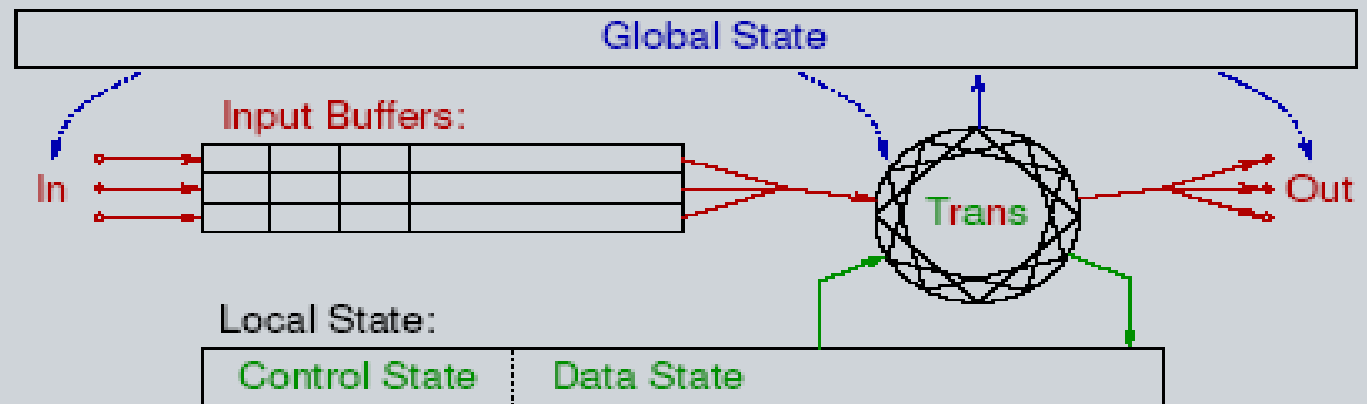

Interacting State Machines  
 Interactive theorem prover (**Isabelle**)

## Formal Security Models

- ▶ A **security policy** defines **what is allowed** (actions, data flow, ...) typically by a relationship between **subjects** and **objects**.
- ▶ A **security model** is a (+/- formal) **description** of a policy and enforcing mechanisms, usually in terms of system **states** or state sequences (**traces**).
- ▶ **Security verification** proves that **mechanisms enforce policy**.
- ▶ Models focus on **specific characteristics** of the reality (policies).
- ▶ Types of formal security models
  - ▶ **Automata** models
  - ▶ **Access Control** models
  - ▶ **Information Flow** models
  - ▶ **Cryptoprotocol** models

## Interacting State Machines (ISMs)

Automata with (nondeterministic) **state transitions** + **buffered I/O, simultaneously** on multiple connections.

Transitions definable in executable and/or axiomatic style.  
 An ISM system may have changing **global state**.  
 Applicable to a large **variety of reactive systems**.  
*By now, not much verification support (theory, tools).*

## Formal model of Infineon SLE 66 Smart Card Processor

System Structure Diagram:

State Transition Diagram (abstracted):

First higher-level (EAL5) certification for a smart card processor!

## Formal RBAC model of Complex Information System

Is the security design (with emergency access etc.) sound?

Privileges:

$roles \subseteq user \times role$

$subroles \subseteq role \times role$

$privs \subseteq role \times privilege$

Permissions:

$groups \subseteq user \times group$

$subgroups \subseteq group \times group$

$gperms \subseteq group \times permission$

$uperms \subseteq user \times permission$

“nagging questions”  $\rightsquigarrow$  clarifications improving specification quality.

Open issue: relation between model and implementation ( $\rightsquigarrow$  testing).

## Information Flow Models

- ▶ Identify knowledge/information domains
  - ▶ Specify **allowed flow** between domains
  - ▶ Check the **observations** that can be made about state and/or actions
  - ▶ Consider also **indirect and partial flow**
- 
- ▶ Classical model:  
Noninterference (Goguen & Meseguer)
  - ▶ Many variants:  
Non-deducability, Restrictiveness, Non-leakage, ...

**Very strong**, but rarely used in practice

*Available:* connection with ISMs

## Language-based Information Flow Security

**Policy:** no assignments of **high**-values to low-variables, enforced by type system

**Semantically:** take  $(x, y)$  as elements of the **state space** with high-level data (**on left**) and low-level data (on right).

**Step function**  $S(x, y) = (S_H(x, y), S_L(x, y))$

does not leak information from high to low

if  $S_L(x_1, y) = S_L(x_2, y)$  (functional **independence**).

**Observational equivalence**  $(x, y) \stackrel{L}{\sim} (x', y') \iff y = y'$

allows re-formulation:

$$s \stackrel{L}{\sim} t \longrightarrow S(s) \stackrel{L}{\sim} S(t) \quad (\text{preservation of } \stackrel{L}{\sim})$$

**Generalization** to action sequences  $\alpha$  and arbitrary policies  $\rightsquigarrow$

# Cryptoprotocol models

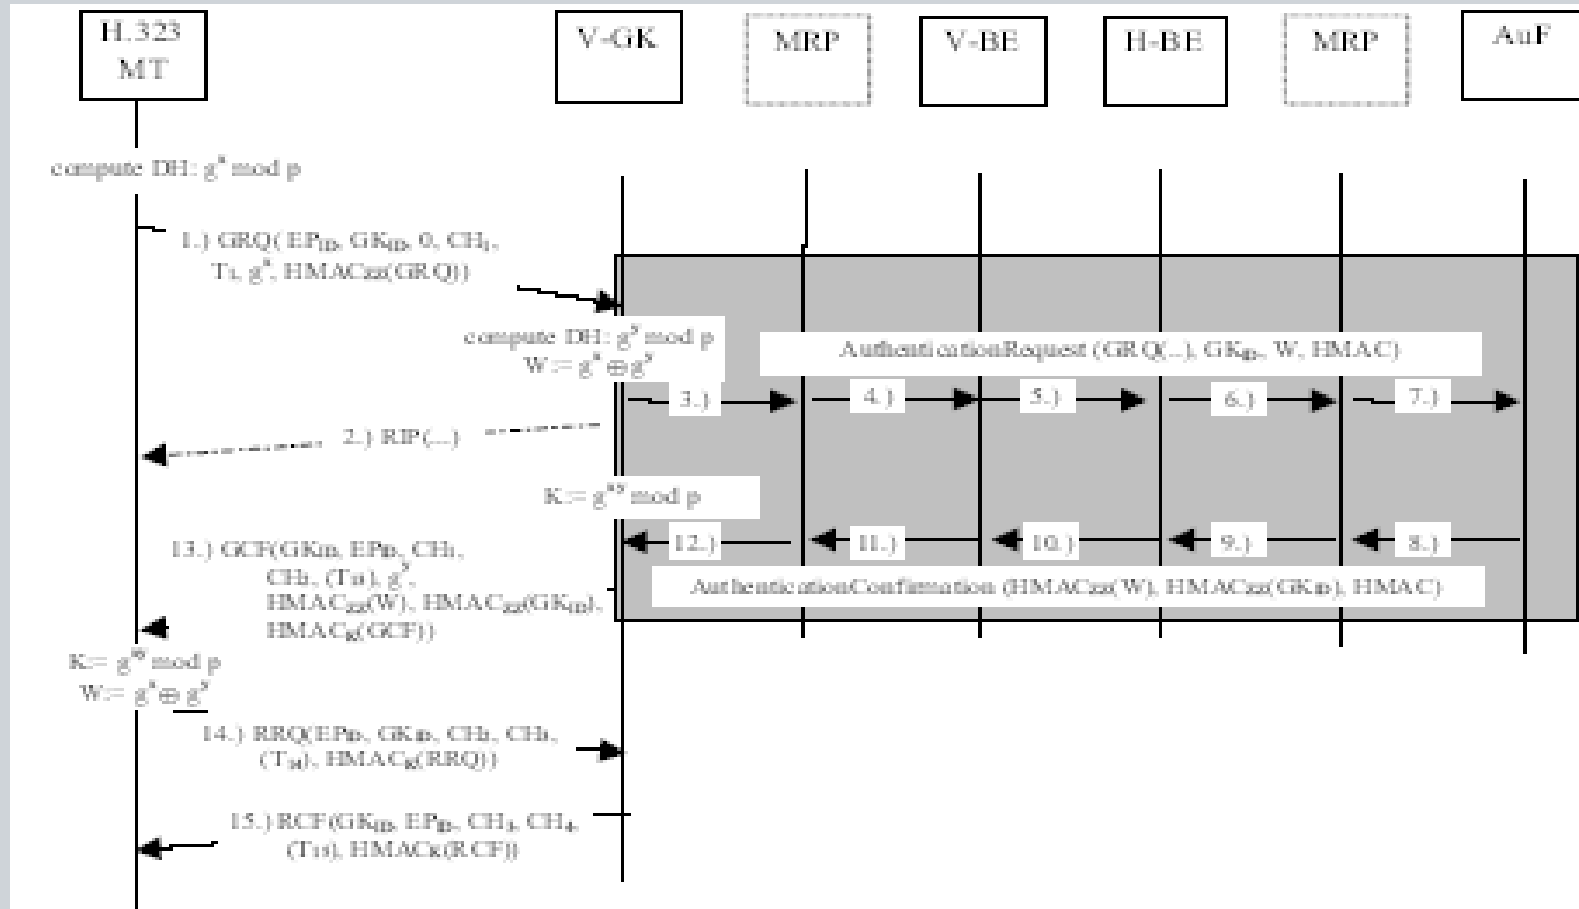

- ▶ Describe **message exchange** between processes or principals

- ▶ Take **cryptographic operations** as **perfect** primitives
- ▶ Describe system with specialized modeling languages
- ▶ State **secrecy, authentication, ...** goals
- ▶ Verify (mostly) **automatically** using model-checkers

EU project **AVISPA**, ...

## Example: H.530 Mobile Roaming Authentication

Two vulnerabilities found and corrected. Solution standardized.

## Overview

- IT Security at Siemens Corporate Technology
- Software distribution systems
- Common Criteria certification
- Formal security analysis
- **Alice-Bob protocol model**
- Validation with AVISPA Tool
- Conclusion on AADS
- Research project AVANTSSAR

## Formal modeling: Alice-Bob notation

```

SUP - {Asset . {h(Asset) . DIS} _inv(KSUP) . CertSUP} _KDIS -> DIS
DIS - {Asset . {h(Asset) . DIS} _inv(KSUP) . CertSUP
      . {h(Asset) . OP } _inv(KDIS) . CertDIS} _KOP -> OP
OP - {Asset . {h(Asset) . DIS} _inv(KSUP) . CertSUP
     . {h(Asset) . OP } _inv(KDIS) . CertDIS
     . {h(Asset) . TD } _inv(KOP ) . CertOP } _KTD -> TD

```

$A - M -> B$  message  $M$  sent from  $A$  to  $B$

$Asset$  a software item including its identity

$h(M)$  the hash value (i.e. crypto checksum) of content  $M$

$M.N$  the concatenated contents of  $M$  and  $N$

$\{M\}_{inv(K)}$  content  $M$  digitally signed with private key  $K$

$\{M\}_K$  content  $M$  encrypted with public key  $K$

## Formal modeling: SDS protocol structure

```

SUP - {Asset . {h(Asset) . DIS }_inv(KSUP) . CertSUP }_KDIS -> DIS
DIS - {Asset . {h(Asset) . DIS }_inv(KSUP) . CertSUP
      . {h(Asset) . OP }_inv(KDIS) . CertDIS }_KOP -> OP
OP - {Asset . {h(Asset) . DIS }_inv(KSUP) . CertSUP
     . {h(Asset) . OP }_inv(KDIS) . CertDIS
     . {h(Asset) . TD }_inv(KOP ) . CertOP }_KTD -> TD

```

<b>SUP</b> : software supplier	with private key <code>inv(KSUP)</code>
<b>DIS</b> : software distributor	with private key <code>inv(KDIS)</code>
<b>OP</b> : target operator	with private key <code>inv(KOP)</code>
<b>TD</b> : target device	with private key <code>inv(KTD)</code>

Signatures comprise hash value of asset and **identity of intended receiver**

Signatures are applied **in parallel** (rather than nested or linearly)

## Formal modeling: SDS approvals and certificates

```

SUP - {Asset. {h(Asset).DIS}_inv(KSUP). CertSUP}_KDIS -> DIS
DIS - {Asset. {h(Asset).DIS}_inv(KSUP). CertSUP
      . {h(Asset).OP}_inv(KDIS). CertDIS}_KOP -> OP
OP   - {Asset. {h(Asset).DIS}_inv(KSUP). CertSUP
      . {h(Asset).OP}_inv(KDIS). CertDIS
      . {h(Asset).TD}_inv(KOP). CertOP}_KTD -> TD

```

- Approval information partially modelled: **operator** determines **target**
- **Certificate** of a node relates its identity with its public key, e.g. certificate of supplier SUP:  $\text{CertSUP} = \{\text{SUP.KSUP}\}_{\text{inv}(\text{KCA})}$
- Certificate authority (CA) with private key  $\text{inv}(\text{KCA})$
- Certificates are **self-signed or signed by CA**
- Locally stored sets of public keys of trusted SSVs and CAs

## Overview

- IT Security at Siemens Corporate Technology
- Software distribution systems
- Common Criteria certification
- Formal security analysis
- Alice-Bob protocol model
- **Validation with AVISPA Tool**
- Conclusion on AADS
- Research project AVANTSSAR

## Verification goals

Show asset **authenticity & integrity (end-to-end)** and **confidentiality**:

- assets accepted by target have indeed been sent by the supplier
- assets accepted by target have not been modified during transport
- assets remain secret among the SSV instances

Asset authenticity & integrity **also hop-by-hop**

**Correct destination** covered:

- Name of the intended receiver in signed part, checked by target.  
Signature of the operator acts as installation approval statement

**Correct version** not modelled:

- Version info is integrity protected, but  
*checks delegated* to SSV local environment

## The AVISPA model

- Alice-Bob notation not detailed and precise enough
- Use the specification language of the AVISPA Tool: **HLPSL**
- Software Signer Verifier (SSV) as **parameterized role** (node class)
- SDS as communication **protocol** linking different SSV instances
- **Multiple** protocol **sessions** describing individual SW transports

Detailed model omitted here

## Results of the AVISPA tools

Details on use of the tools omitted here

Verification successful for small number of protocol sessions

- Modelcheckers at their complexity limits, due to
  - parallel signatures, only the latest one being checked
  - multiple instances of central nodes (e.g. manufacturer)
  - ...?

## Overview

- IT Security at Siemens Corporate Technology
- Software distribution systems
- Common Criteria certification
- Formal security analysis
- Alice-Bob protocol model
- Validation with AVISPA Tool
- **Conclusion on AADS**
- Research project AVANTSSAR

## Conclusion (1) on AADS

- Challenges for AADS development
  - **pioneering** system design and architecture
  - **complex**, heterogeneous, distributed system
  - security is **critical** for both safety and business
- Common Criteria offer **adequate methodology** for assessment, at least for small components/systems
- **Systematic approach**, in particular **formal analysis**, enhances
  - **understanding** of the security issues
  - **quality** of specifications and documentation
  - **confidence** (of Boeing, customers, FAA, etc.) in the security solutions

## Conclusion (2) on AADS

- Experience with SDS evaluation
  - Common Criteria **most widely accepted methodology**
  - Problem of **compositional** security evaluation not solved
  - Use formal analysis where **cost/benefit ratio** is best
  - Highly **precise design and documentation**:  
assumptions, requirements
  - Shape system **architecture** to **support** security evaluation
  
- Future steps
  - **Key management** aspects:  
Public Key Infrastructure (PKI) components etc.
  - **Configuration management**  
with installation instructions and status/completion reports

## AVANTSSAR project data

[avantssar.eu](http://avantssar.eu)

# Automated Validation of Trust and Security of Service-oriented ARchitectures

**EU FP7-2007-ICT-1, ICT-1.1.4, Strep project no. 216471**

Jan 2008 - Dec 2010, 590 PMs, 6M€ budget, 3.8M€ EC contribution

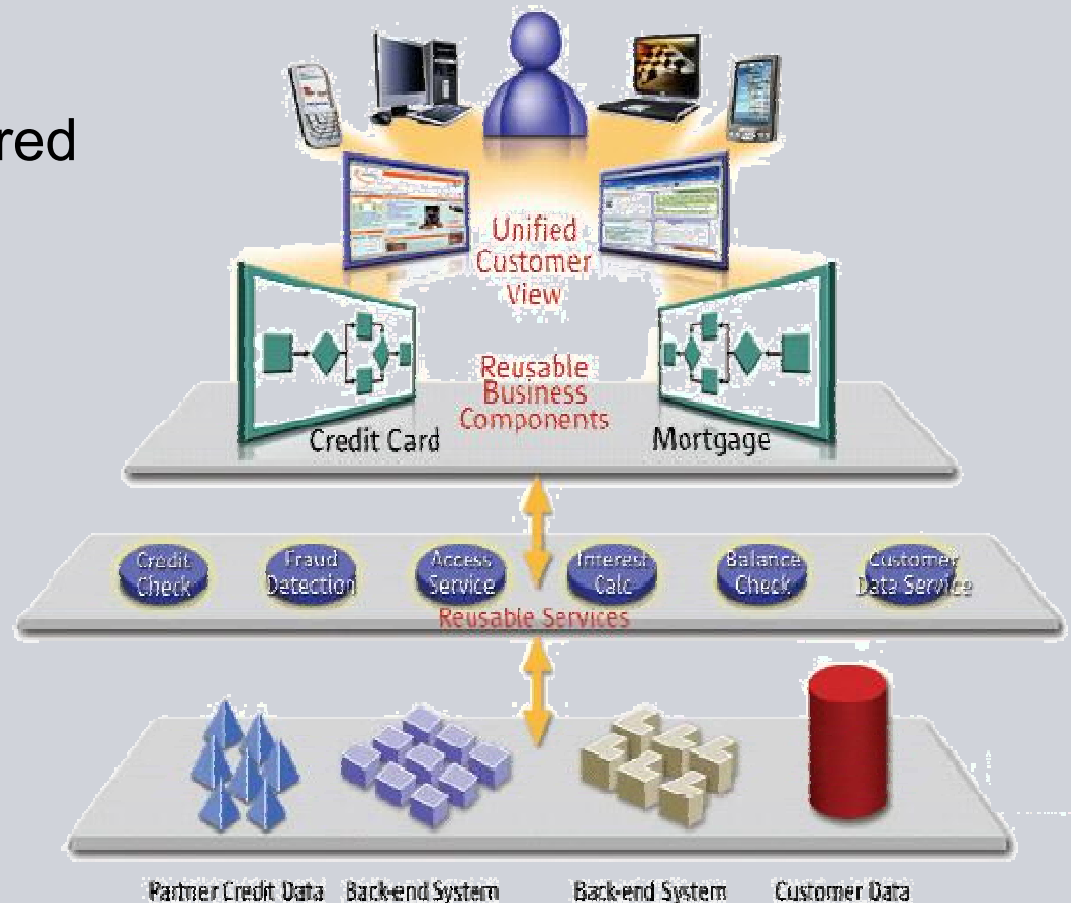

## AVANTSSAR project motivation

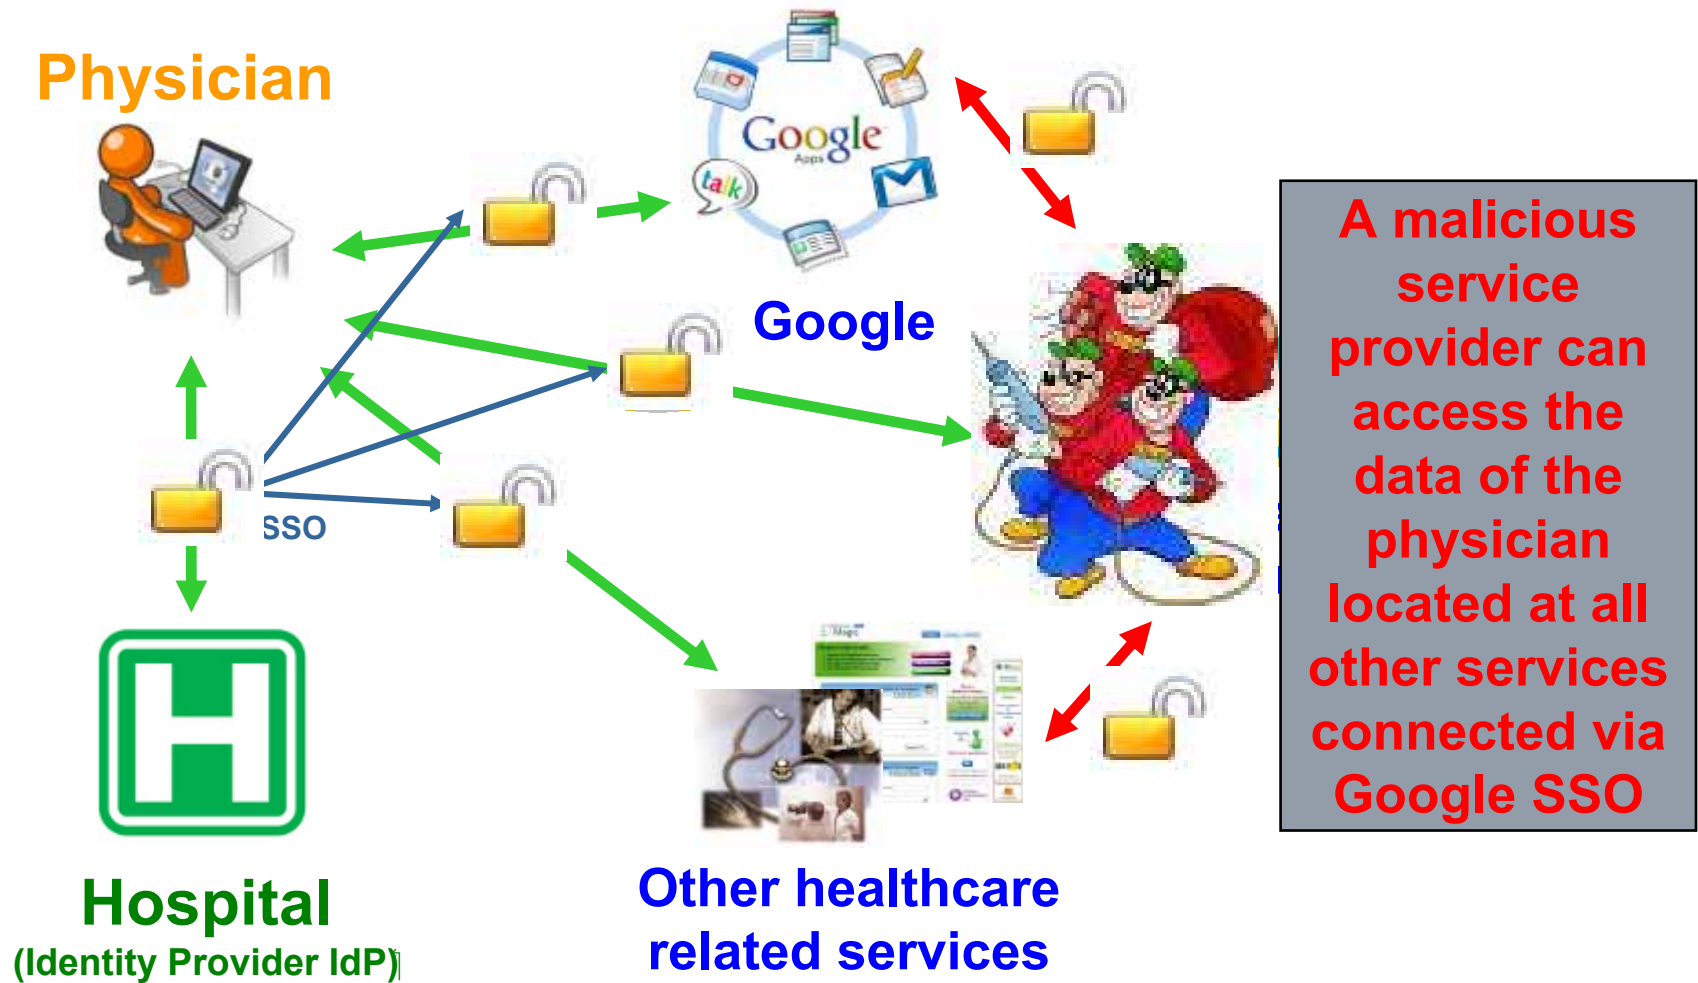

ICT paradigm shift: from components to **services**, composed and reconfigured dynamically in a demand-driven way.

Trustworthy service may **interact** with others causing novel trust and security problems.

For the composition of individual services into service-oriented architectures, **validation** is dramatically needed.

## Example 1: Google SAML-based Single Sign-On (SSO)

# Example 1: Google SAML SSO protocol flaw

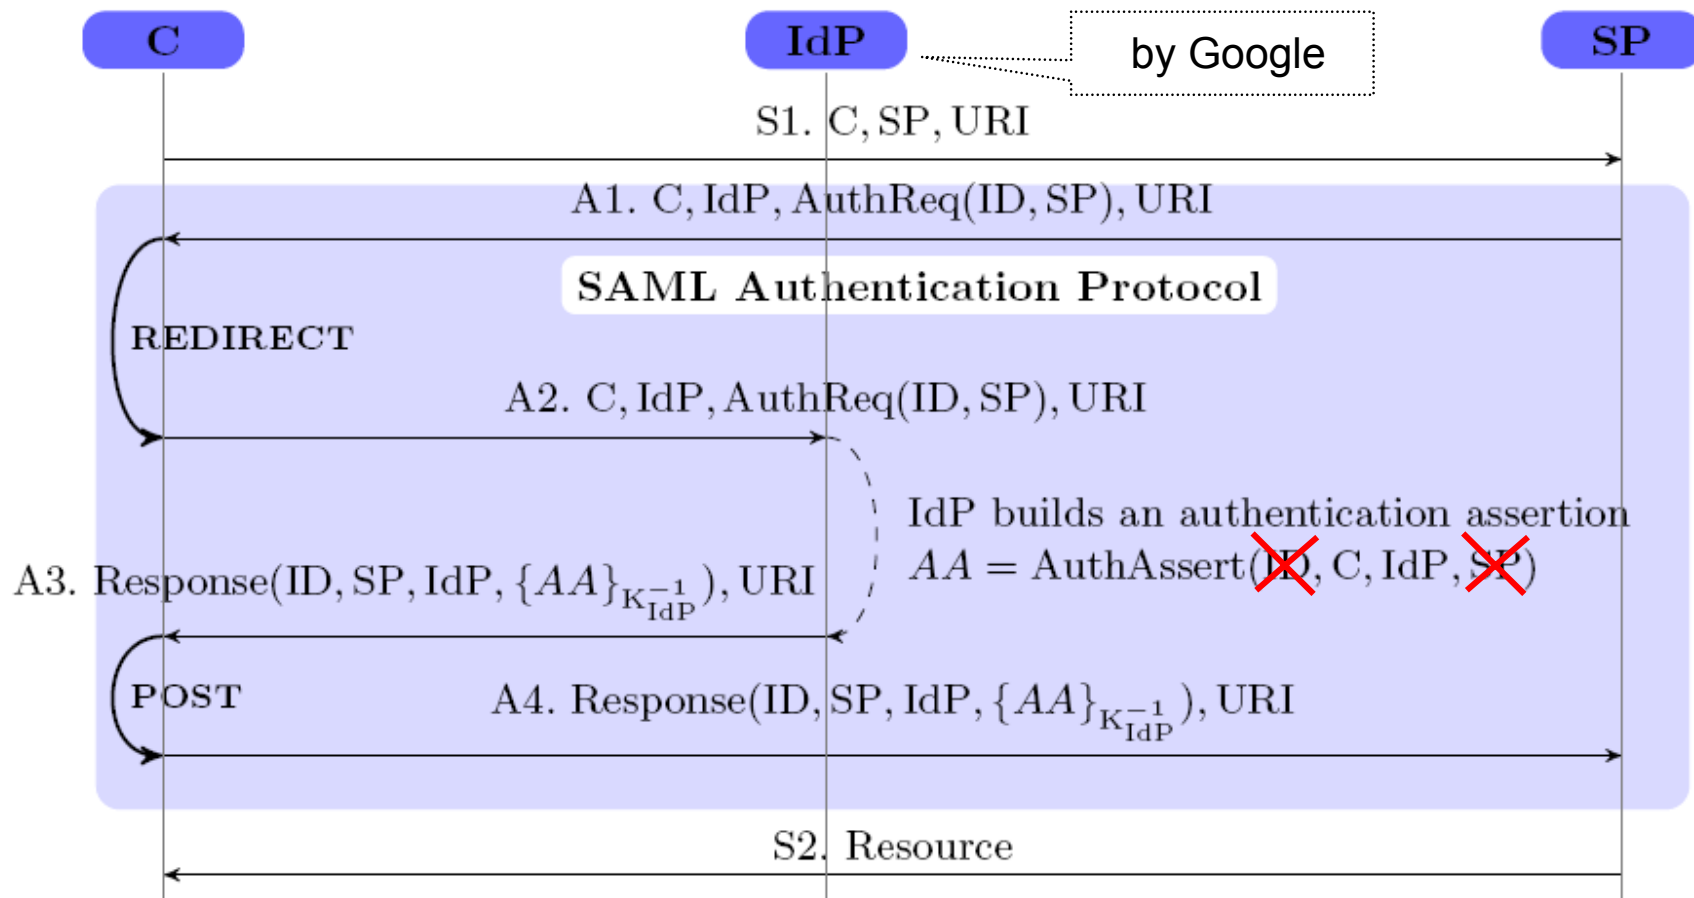

Fig. 1. SP-Initiated SSO with Redirect/POST Bindings

## Expertise

Service-oriented enterprise architectures  
 Security solutions  
 Standardization and industry migration

Security engineering  
 Formal methods  
 Automated security validation

# AVANTSSAR main objectives and principles

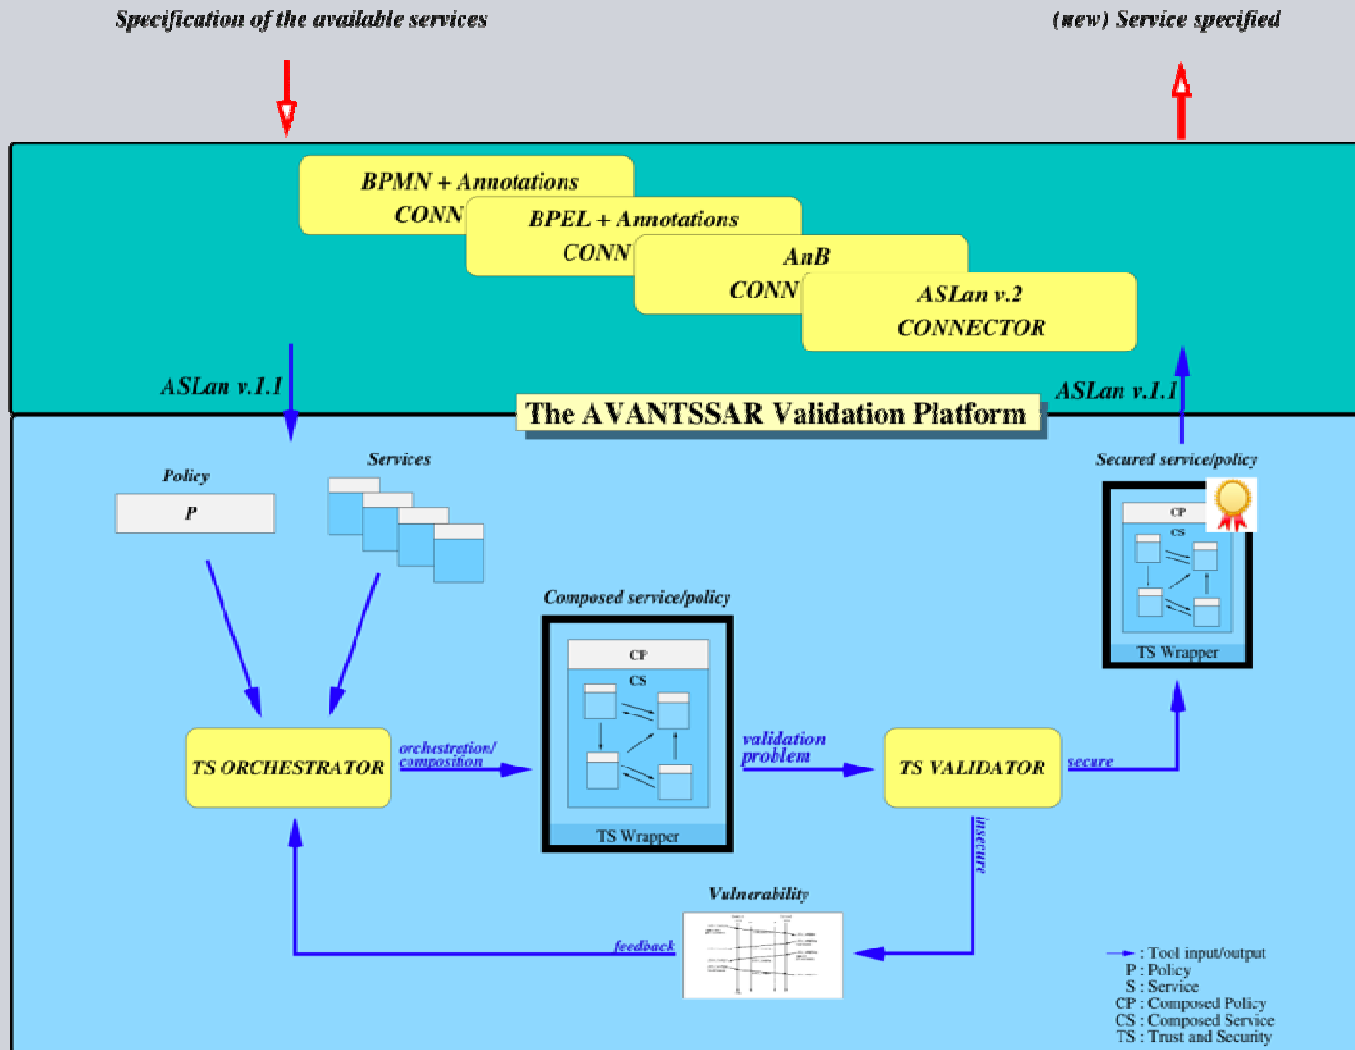

## AVANTSSAR product: Platform for formal specification and automated validation of trust and security of SOAs

- **Formal language** for specifying trust and security properties of services, their policies, and their composition into service-oriented architectures
- **Automated toolset** supporting the above
- **Library** of validated industry-relevant case studies

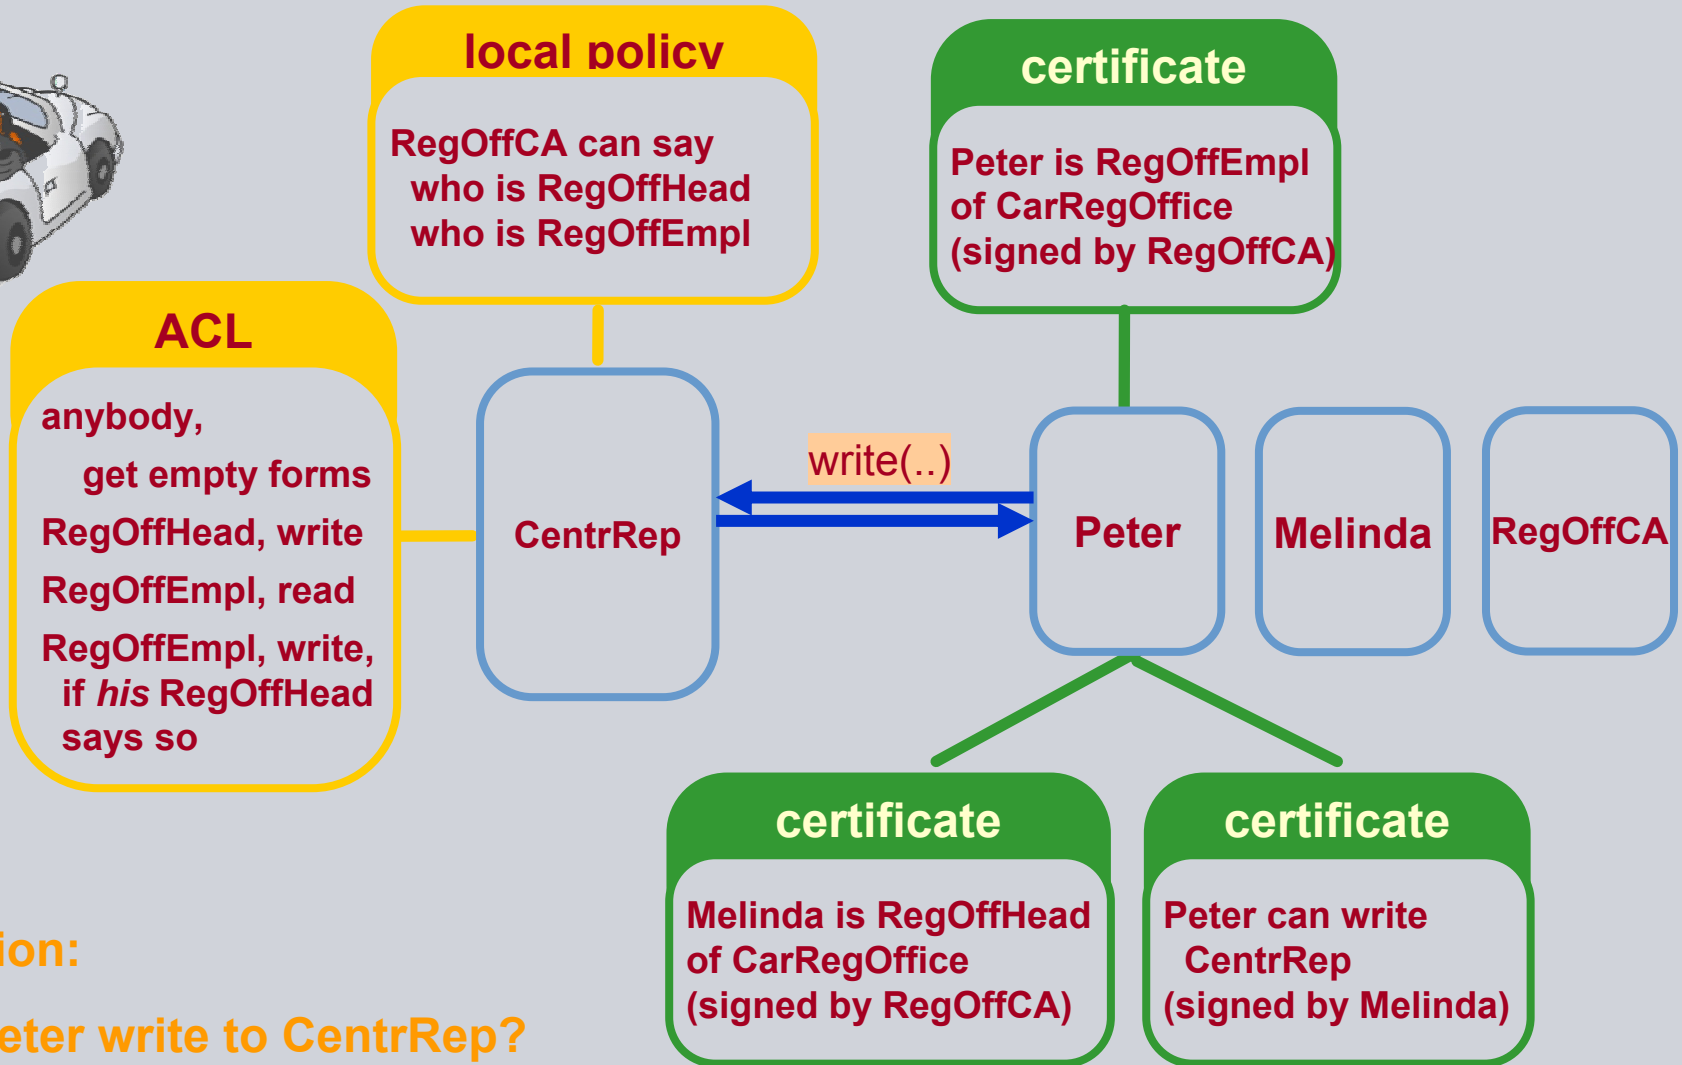

## Migration of platform to industry and standardization organizations

- **Speed up development** of new service infrastructures
- **Enhance** their **security** and robustness
- **Increase public acceptance** of SOA-based systems

# AVANTSSAR project results and innovation

# Example 2: Electronic Car Registration policies

Question:

May Peter write to CentrRep?

## Example 3: Process Task Delegation (PTD)

### Authorization and trust management via token passing

There are three roles in the protocol (**C**, **A**, **TS**)  
and potentially several instances for each role

The *client C* (or *user*) uses the system for  
SSO, authorization and trust management

Each *application A* is in one domain,  
each domain has exactly one active *token server TS*

**A1** uses the system to pass to **A2** some **Order**  
and an **ADT (Authorization Decision Token)**

- **Order** contains:
  - workflow task information
  - application data
  - information about the client **C** and his current activity to be delivered securely (integrity and confidentiality)
- **ADT** is mainly authorization *attributes* and *decisions*
  - sent via **TS1** and **TS2**, who may weaken it
  - must remain unaltered, apart from weakening by **TS**
  - must remain confidential among intended parties

**C**, **A1**, and **A2** must be authenticated among each other

### Security prerequisites:

PKI is used for **A** and **TS**, username & pwd for **C**  
**TS** enforces a strict time-out

## Example 3: ASLan++ model of A2

```

entity A2 (Actor: agent, TS2: agent) { % Applicaton2, connected with TokenServer2
  symbols
    C0,C,A1: agent;
    CryptedOrder, Order, Order0, Details, Results, TaskHandle, ADT, HMAC: message;
    SKey: symmetric_key;
  body { while (true) {
    select {
      % A2 receives (via some C0) a package from some A1. This package includes encrypted and
      % hashed information. A2 needs the corresponding key and the Authorization Decision Token.
      on (?C0 -> Actor: (?A1.Actor.?TaskHandle.?CryptedOrder)?.?HMAC): {
        % A2 contacts its own ticket server (TS2) and requests the secret key SKey and the ADT.
        Actor *->* TS2: TaskHandle;
      }
      % A2 receives from A1 the SKey and checks if the decrypted data corresponds to the hashed data
      on (TS2 *->* Actor: (?ADT.?SKey).TaskHandle & CryptedOrder = scrypt(SKey,?,?Details.?C)
        & HMAC = hmac(SKey, A1.Actor.TaskHandle.CryptedOrder)): {
        % A2 does the task requested by A1, then sends to A1 via C the results encrypted with the secret key.
        Results := fresh(); % in general, the result depends on Details etc.
        Actor -> C: Actor.C.A1. scrypt(SKey,Results);
      }
    }
  }
  goals
    authentic_C_A2_Details: C *-> Actor: Details;

# AVANTSSAR final status

**SIEMENS**

**WP2: ASLan++** supports the formal specification of trust and security related aspects of SOAs, and of static service and policy composition

**WP3:** Techniques for: satisfiability check of policies, model checking of SOAs w.r.t. policies, different attacker models, compositional reasoning, abstraction

**WP4:** Deploy first prototype of **AVANTSSAR Platform**

**WP5:** Formalization of **industry-relevant problem cases** as ASLan++ specifications and their validation

**WP6:** Ongoing dissemination and migration into scientific community and industry

## AVANTSSAR toolset demo

Try the platform at [avantssar.eu](http://avantssar.eu)

- Needham-Schroeder Public Key Protocol
- TLS Client and Server

# AVANTSSAR impact: industry migration

Services need to be securely combined according to evolving trust and security requirements and policies.

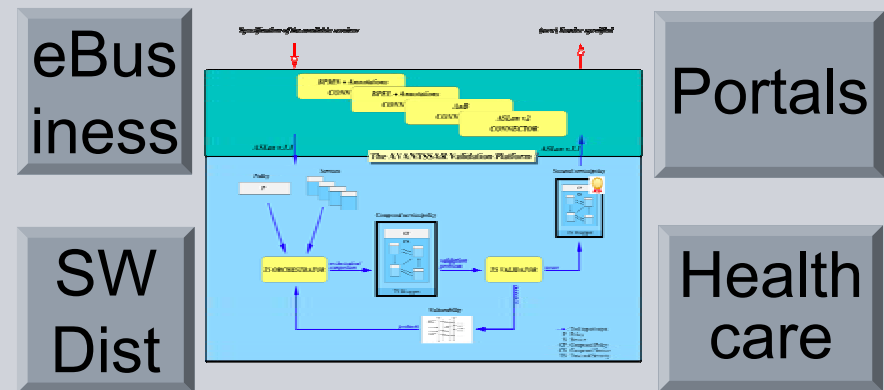

A rigorous demonstration that a composed SOA meets the security requirements and enforces the application policy will:

- significantly increase customers' confidence
- enable customers to fully exploit the benefits of service orientation

## Integration of AVANTSSAR Platform in industrial development environment

The AVANTSSAR Platform will advance the security of industrial vendors' service offerings: **validated, provable, traceable.**

AVANTSSAR will thus strengthen the competitive advantage of the products of the industrial partners.

## Overview

- IT Security at Siemens Corporate Technology
- Software distribution systems
- Common Criteria certification
- Formal security analysis
- Alice-Bob protocol model
- Validation with AVISPA Tool
- Conclusion on AADS
- Research project AVANTSSAR
- **Conclusion on Formal Security Analysis**

## Shaping a Formal Model

**Formality Level:** should be adequate:

- ▶ the more formal, the more **precise**,
- ▶ but requires deeper mastering of formal methods

**Choice of Formalism:** dependent on ...

- ▶ application domain, modeler's experience, tool availability, ...
- ▶ formalism should be **simple, expressive, flexible, mature**

**Abstraction Level:** should be ...

- ▶ high enough to achieve **clarity** and limit the **effort**
- ▶ low enough not to lose **important detail**

*refinement* allows for both high-level and detailed description

## Formal Security Analysis: Information Required

- **Overview**: system architecture (components and interfaces), e.g. databases, authentication services, connections,...
- **Security-related concepts**: actors, assets, states, messages, ...
- **Threats**: which attacks have to be expected.
- **Assumptions**: what does the environment fulfill.
- **Security objectives**: what the system should achieve.  
Described **in detail** such that concrete verification goals can be set up  
e.g. integrity: which contents shall be modifiable by whom, at which times, by which operations (and no changes otherwise!)
- **Security mechanisms**: relation to objectives and how they are achieved.  
e.g. who signs where which contents, and where is the signature checked  
Described **precisely** but **at high level** (no implementation details required),  
e.g. abstract message contents/format but not concrete syntax

## Development Phases and the Benefits of Formal Analysis

### Requirements analysis:

understanding the security issues

- **abstraction**: concentration on essentials, to keep overview
- **genericity**: standardized patterns simplify the analysis

### Design, documentation:

quality of specifications

- **enforces preciseness** and **completeness**

### Implementation:

effectiveness of security functionality

- formal model as precise reference for **testing and verification**
